

Specimen Collection for Lymphogranuloma venereum (LGV) testing

* For patients with classic LGV symptoms (eg. genital papule or ulcer and inguinal lymphadenopathy) and for patients who are asymptomatic sex partners of LGV case patients, collect urethral (or urine) specimens and test locally for CT. If positive for CT, send urethral/urine specimen and serology to CDC for typing. (See instructions)

CDC laboratory testing for Lymphogranuloma venereum (LGV)

NOTE: There are three patients with two specimens. The results of the first specimen tested are included in the flow. Results for second specimens were 2 CT negative and 1 pending.
